

Columba Antarctica

London Published Oct. 1. 1793. by J. Bowyer & Co. N^o. 2. Moat Place. Lambeth.

COLUMBA ANTARCTICA.**THE ANTARCTIC PIGEON.****CHARACTER GENERICUS.**

Rostrum rectum, versus apicem descendens.

Nares oblongae, membrana molli tumida semitectae.

Lingua integra.

Lin. Syst. Nat. p. 279.

CHARACTER SPECIFICUS.

Columba plumbeo-grisea, subtus pallidior, occipite crista dependente ferruginea, remigibus caudaque nigricantibus, rectricibus fascia pallida.

GENERIC CHARACTER.

Bill weak, slender, strait at the base, with a soft protuberance in which the nostrils are lodged.

Tongue entire.

Legs short: toes divided to the origin.

SPECIFIC CHARACTER.

Greyish-lead-coloured Pigeon, paler beneath, with the wings and tail blackish; the latter marked by a pale bar.

THE Pigeon here represented appears to be a species hitherto undescribed. In size it nearly equals the *Columba Palumbus*, or common Wood-pigeon. Its most distinguishing character is the elegant semi-pendent occipital crest; a particular not often observable in birds of this genus.
